DETAILED ACTION

Continued Examination Under 37 CFR 1.114

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on April 17, 2006 has been entered.

Response to Amendment

2. Claims 1 and 13 have been amended, claims 5 and 18 have been deleted and no new claims have been added. Hence, claims 1-4, 6-17 and 19-26 are pending in the application.

Claim Objections

3. Claim 13 is objected to because of the following informalities: in claim 13, line 1, the status identifier "(original)" should be replaced with the status identified "(currently amended)" since the claim has been amended. Appropriate correction is required.

Claim Rejections - 35 USC § 103

4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

Application/Control Number: 10/603,394

Art Unit: 1755

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Page 3

1. Claims 1-4, 6-17 and 19-26 are rejected under 35 U.S.C. 103(a) as being unpatentable over Yoshida et al. (US 5,507,865) in view of Moffatt et al. (US 5,106,416).

Yoshida et al. teach an aqueous ink jet ink composition comprising 0.1-20% by weight of a water-soluble dye, preferably a black dye, 0.01-20% by weight of an amino acid such as arginine, lysine, histidine, ornithine and derivatives thereof and water. Yoshida et al. further teach that additives such as surfactants may be added for their normal functions. See col. 2, lines 25-55, dyes (A), (B) and (C), col. 3, lines 50-65, col. 4, lines 32-58, examples 1-3, Table 2 and claims 1-6. Yoshida et al. fail to specifically teach the addition of an amphoteric (i.e. zwitterionic) surfactant as claimed by applicants.

Moffatt et al. teach an ink jet ink composition containing a zwitterionic surfactant such as N,N-dimethyl-N-dodecyl amine oxide, N,N-dimethyl-N-tetradecyl amine oxide, N,N-dimethyl-N-hexadecyl amine oxide, N,N-dimethyl-N-octadecyl amine oxide, N,N-dimethyl-N-(Z-9-octadecenyl)-N-amine oxide, N- dodecyl –N,N-dimethyl glycine and sulfobetaines wherein the surfactant improves the color bleed between inks. See col. 2, lines 33-36,col. 3, lines 45-50, col. 4, lines 20-64, col. 5, lines 12-20, col. 8, lines 13-18 and claims 1-3, 6 and 7.

Art Unit: 1755

Therefore, it would have been obvious to one having ordinary skill in the art to modify the aqueous ink jet ink of Yoshida et al. by adding the zwitterionic surfactant of Moffatt et al. in order to improve the color bleed of the aqueous ink when printed next to another ink composition.

Response to Arguments

2. Applicant's arguments filed April 17, 2006 have been fully considered but they are not persuasive.

Applicants argue that there is no motivation to combine the Yoshida et al. and Moffat et al. references since the Yoshida reference adds an amino acid to improve water resistance, provide satisfactory image density and prevent bronzing and the Moffat reference adds an amphoteric surfactant to alleviate bleeding between inks. The examiner disagrees since the amphoteric surfactant of Moffatt et al. is added to provide an additional benefit (i.e. preventing bleeding) in addition to the other benefits already shown in the Yoshida reference. Furthermore, applicants state in their specification that the addition of the amphoteric surfactant helps to prevent bleeding between a black ink jet ink of the present invention and a colored ink jet ink (see page 6, lines 10-12).

Applicants further argue that the Yoshida et al. reference only mentions the addition of a surfactant and never specifically identifies that an amphoteric surfactant can be used and unless an amphoteric surfactant is added, increased penetration occurs and negatively impacts the optical density of the ink. The examiner disagrees since the use of the term "surfactant" suggests the addition of any surfactant that is

Application/Control Number: 10/603,394

Art Unit: 1755

typically added to ink compositions. Therefore, it is the examiner's position that the addition of the amphoteric surfactant of Moffatt et al. along with it's ability to prevent bleeding would have been obvious to one having ordinary skill in the art absent a showing to the contrary. Furthermore, applicants argue that the Moffatt et al. reference does not specifically exemplify the use of an amphoteric surfactant and only exemplifies the use of Surfynol 465 (i.e. nonionic surfactant) and therefore, there is no specific suggestion in the Moffatt et al. reference of using an amphoteric surfactant over other types of surfactants. The examiner disagrees since the example in the Moffatt et al. reference (see col. 8, lines 13-18) also includes an amphoteric surfactant (i.e. OOAO) in the amounts as claimed by applicants in combination with the nonionic surfactant. Therefore, it is the examiner's position that the Moffatt et al. reference does provide a suggestion of using the amphoteric surfactant as claimed. The examiner suggests providing evidence that an ink containing an amino acid and an amphoteric surfactant would have unexpected results as compared to an ink containing an amino acid and a surfactant other than amphoteric such as nonionic and/or cationic surfactant. Applicants should note that the examples in the specification only compare an ink containing an amino acid and an amphoteric surfactant to an ink that does not contain an amino acid but does contain an amphoteric surfactant. The examiner will consider any evidence as described above as long as it is submitted in response to this Office Action.

Conclusion

Page 6

The remaining references listed on forms 892 and 1449 have been reviewed by the examiner and are considered to be cumulative to or less material than the prior art references relied upon in the above rejections.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Helene Klemanski whose telephone number is (571) 272-1370. The examiner can normally be reached on Monday-Friday 5:30-2:00.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Jerry Lorengo can be reached on (571) 272-1233. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic

Business Center (EBC) at 866-217-9197 (toll-free).
